## ***Talking: Web***

Web design is the hardest thing you will ever do in life. At least when you do it for the first time.

## **Talking: Resources**

**Yale:** <http://info.med.yale.edu/caim/manual/>

**Design for designers:** <http://www.wpdfd.com/>

**Design guide with tutorials:** <http://dreamink.com/>

**Recommended search term:** web design

## ***Notes***

# 2

## ***Talking: Code***

HTML code.

Hypertext Markup Language

What is HTML?

HTML is a high-level computer language. It translates our written words into something that can be “read” by the computer to create a page as we want it to look...

## ***Talking: HTML Editors***

HTML editors are the software programs that can be used to write HTML code.

## ***Talking: Wysiwyg editors***

Microsoft Front Page

Macromedia Dreamweaver

Adobe PageMill

Netscape Composer

## ***Talking: Resources***

**Microsoft Front Page tutorial:** [http://www.kayetech.com/fp\\_content.htm](http://www.kayetech.com/fp_content.htm)

**Varied items but free:** <http://www.htmlgoodies.com/>

**Handy colours from down under:** <http://htmlguide.alphalink.com.au/htmlguide/>

**Recommended search term:** html

## ***Notes***

# 3

## ***Talking: <tags>***

You will be able to find HTML tag lists in books and on the Internet (otherwise known as the World Wide Web).  
A tag is a command which tells the browser how to display a page element. Brackets enclose the actual **<tag>**.

**HTML, a highly tolerant *language*, does allow:**

s p a c e s and CAPITAL LETTERS...  
(...however, you must get the spelling right!)

<b><i>TAG</i></b>	<b><i>DESCRIPTION</i></b>
<code>&lt;title&gt;</code>	Creates page title
<code>&lt;body&gt;</code>	Visible text of web page
<code>&lt;p&gt;</code>	Begins new paragraph
<code>&lt;b&gt;</code>	<b>Bold</b> text
<code>&lt;i&gt;</code>	<i>Italic</i> text

**Example:**

```
<p align="center">This is centered</p>
      This is centered
<p>This is not</p>
This is not
```

## **Talking: Resources**

**Comprehensive list of tags:** [http://www.wdvl.com/Quadzilla/Tag\\_Ref/ref\\_list.html](http://www.wdvl.com/Quadzilla/Tag_Ref/ref_list.html)

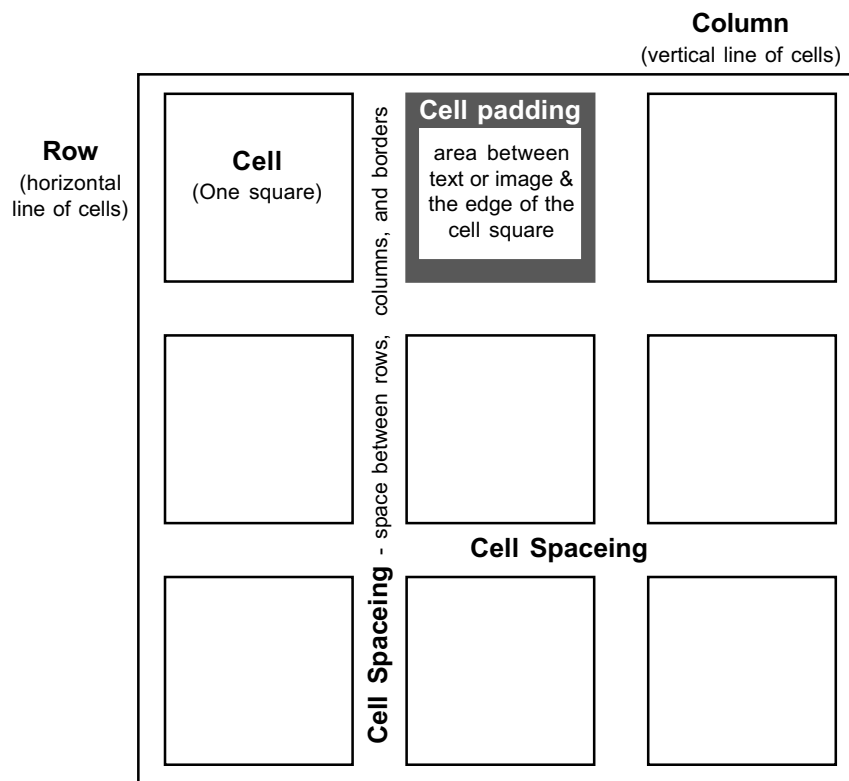

**Recommended search term:** html tags

## ***Notes***

# 4

## Talking: Tables

**Borderless table:** *beginning tag:* `<table border="0" width="100%" align="center">`  
*ending tag:* `</table>`

## ***Talking: Color***

### **Web Safe Colors**

These are the colors that show up consistently on every monitor.  
You will find charts with web-safe colors in computer books and on the Internet.

### **Background**

The background you use can make the difference as to whether or not the viewers will stick with your page long enough to read the information you have provided.

### **Contrast**

Keep a good contrast (the difference between dark and light).  
Also, be careful when choosing colors that might be too closely related.

### **Patterns**

There is just not enough time to sit in front of a computer monitor and decode a web site whose background and foreground create a **stereogram**.

Use a background that is compatible with your web design  
and makes the text and images easy to view.

## **Talking: Resources**

**Stereograms:** <http://www.ioon.net/martian/gallery/stereogram.html>

**Web safe colors:** <http://www.colostate.edu/Depts/CoopExt/SITE/colortab.html>

**Backgrounds:** [http://www.webdevelopersjournal.com/columns/abc\\_mistakes.html](http://www.webdevelopersjournal.com/columns/abc_mistakes.html)

## ***Notes***

# 6

## ***Talking: Images***

Image file types supported by web consistently are the GIF (**.gif**) and the JPG (**.jpeg** or **.jpg**) files.

*“One image is worth a thousand words”* but on the web it depends upon how quickly the image loads.

Slow-to-load images make users leave a page. Therefore, link small images to larger ones or warn of large image sizes.

### **GIF**

Graphics Interchange Format—the file names end in **.gif**

GIF files are the most supported of the types of image files for the web.

They have a maximum of 256 colors (AKA 8-bit).

The GIF does not lose any file information during compression to make the file smaller!

### **Animated GIF Images**

Latest marketing research—when people see an animated gif, they are more likely to leave without reading anything.

### ***Transparent GIF Images***

GIF89a files are used because they can be made to be transparent.

### **JPG**

Joint Photographic Experts Group—the file names end in **.jpg**

24-bit color: better choice for photographs unless compression makes the image quality poor.

The JPEG “lossy compression” file information is lost during compression to make the file smaller!

### **.avi .mpg .wav**

These are multimedia files. Multimedia files allow sound and/or video information to be displayed.

## **Talking: Resources**

**Adding images:** [http://www.webdevelopersjournal.com/columns/abc\\_graphics.html](http://www.webdevelopersjournal.com/columns/abc_graphics.html)

**Graphics:** [http://www.webdevelopersjournal.com/columns/web\\_graphics.html](http://www.webdevelopersjournal.com/columns/web_graphics.html)

**Examples of JPEG and GIF files:** [http://www.webdevelopersjournal.com/columns/web\\_graphics\\_formats.html](http://www.webdevelopersjournal.com/columns/web_graphics_formats.html)

## **Notes**

# 7

## Talking: Type

The easiest way to talk type is to talk—text—words.

Type = text = words

*Serif* (note pretty little attachment hanging onto each letter) vs **sans serif** (without the hangers on)

In most print, serif is read faster by the American eye ... but sans serif is better on the web.

Use: ' ' " " "typographer's quotes" AKA "curly quotes"

em dash	en dash	hyphen
—	—	-

In web typography and print typography,  
minimize the use of *italics* and ALL CAPS.

Adding text to images	
Hint 1	text goes in last
Hint 2	use sans serif type
Hint 3	do not dither (if possible)
Hint 4	compare to a GIF if you used more than a few colors
Hint 5	do not re-size the image after the text has been added
